

Traffic Impact Study

Proposed Justice Cannabis Dispensary

Joliet, Illinois

Prepared For:

March 24, 2022

1. Introduction

This report summarizes the methodologies, results, and findings of a traffic impact study conducted by Kenig, Lindgren, O'Hara, Aboona, Inc. (KLOA, Inc.) for the proposed Justice Cannabis dispensary to be located at 2211 West Jefferson Street in Joliet, Illinois. The site, which currently contains the former Bakers Square restaurant building, is located on the north side of Jefferson Street (US 52) west of Hammes Avenue. As proposed, the existing building will be repurposed to provide an approximately 4,060 square-foot dispensary with approximately 65 parking spaces. Access to the site will continue to be provided via the existing shared access drive off Jefferson Street.

The purpose of this study was to examine background traffic conditions, assess the impact that the proposed dispensary will have on traffic conditions in the area, and determine if any roadway or access improvements are necessary to accommodate the traffic generated by the proposed dispensary.

Figure 1 shows the location of the site in relation to the area roadway system. **Figure 2** shows an aerial view of the site.

The sections of this report present the following:

- Existing roadway conditions
- A description of the proposed dispensary
- Directional distribution of the dispensary traffic
- Vehicle trip generation for the dispensary
- Future traffic conditions including access to the dispensary
- Traffic analyses for the weekday morning, weekday evening, and Saturday midday peak hours
- Recommendations with respect to adequacy of the site access and adjacent roadway system
- Parking evaluation to determine the adequacy of the parking supply

Traffic capacity analyses were conducted for the weekday morning, weekday evening, and Saturday midday peak hours for the following conditions:

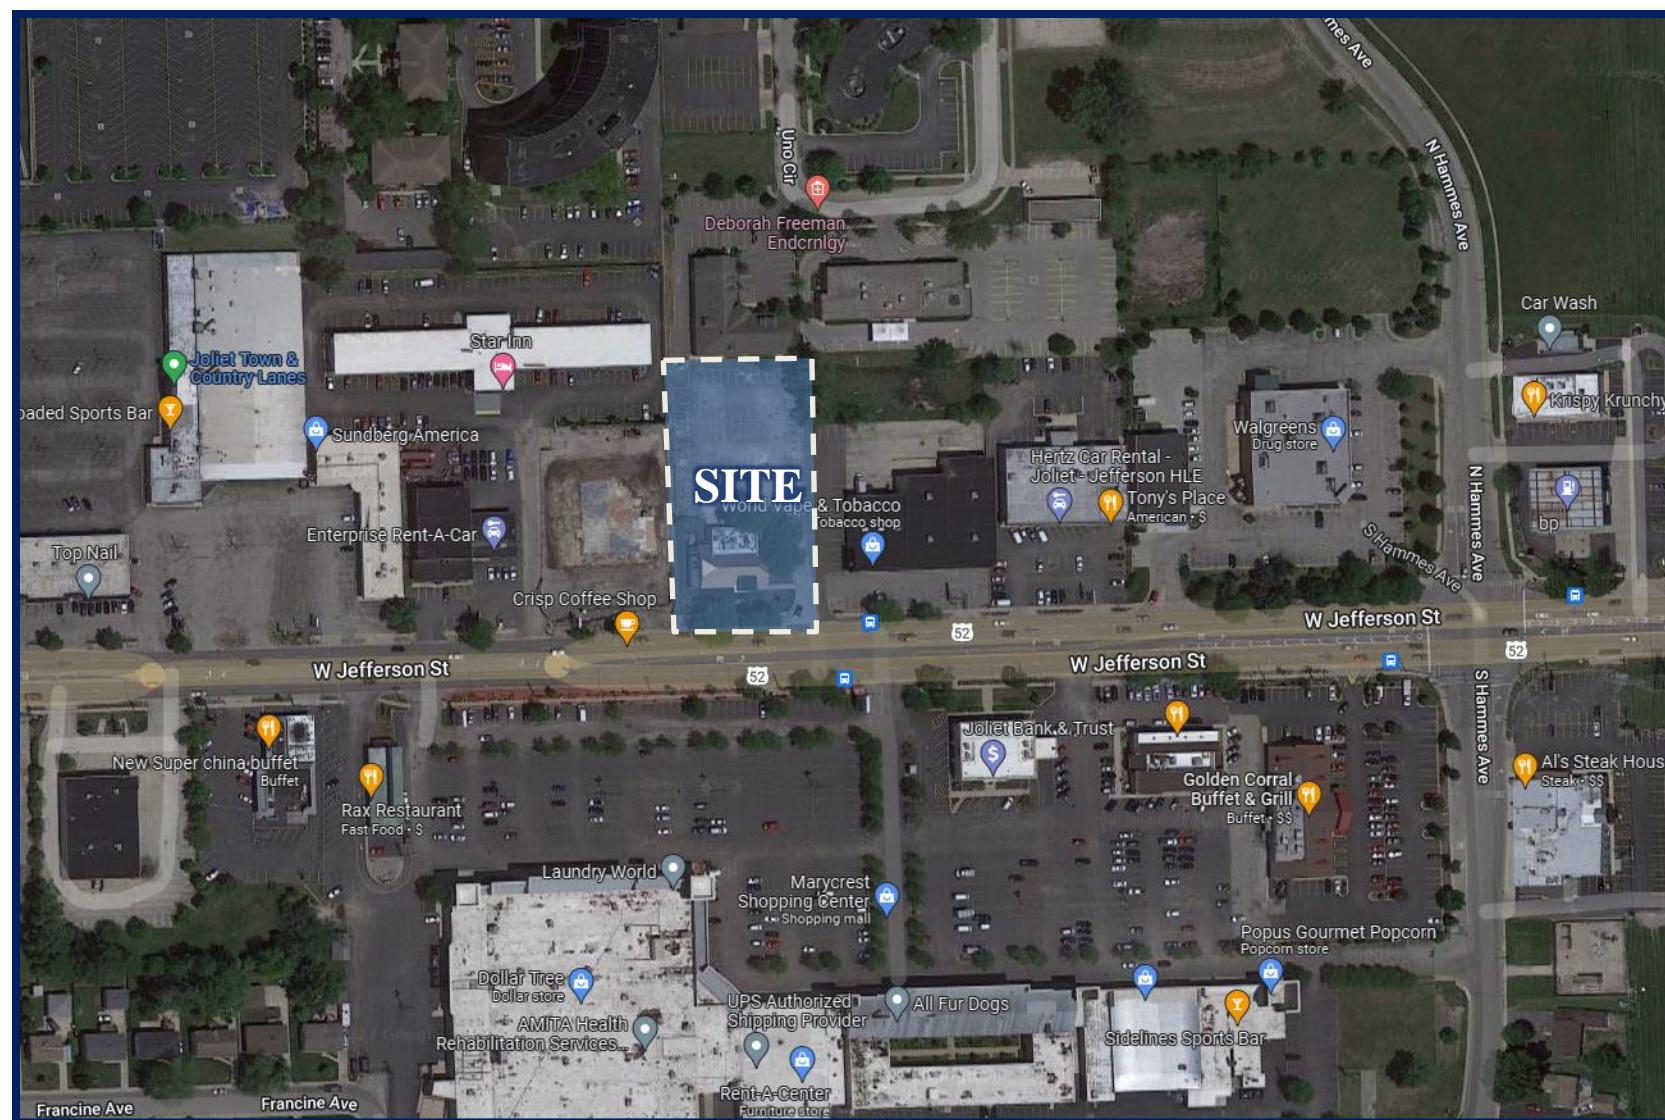

1. Existing Conditions – Analyze the capacity of the existing roadway system using existing peak hour traffic volumes in the surrounding area.
2. No-Build Conditions – Analyzes the capacity of the existing roadway system using existing peak hour traffic volumes increased by an ambient area growth factor not attributable to any particular development.
3. Projected Conditions – Analyzes the capacity of the future roadway system using the projected traffic volumes that include the existing traffic volumes, ambient area growth not attributable to any particular development, and the net increase in traffic estimated to be generated by the proposed dispensary.

2. Existing Conditions

Existing transportation conditions in the vicinity of the site were documented in order to obtain a database for projecting future conditions. The following provides a description of the geographical location of the site, physical characteristics of the area roadway system including lane usage and traffic control devices, and existing peak hour traffic volumes.

Site Location

The site, which currently contains the former Bakers Square restaurant building, is located on the north side of Jefferson Street (US 52) west of Hammes Avenue. Land uses in the immediate area are primarily commercial with a variety of retail, restaurant, and service establishments along Jefferson Street.

Existing Roadway System Characteristics

The characteristics of the existing roadways near the site are described below and illustrated in **Figure 3**.

Jefferson Street (US 52) is an east-west other principal arterial roadway which generally provides two lanes in each direction in the vicinity of the site separated by a median that accommodates exclusive left-turn lanes. At its signalized intersection with Hammes Avenue, Jefferson Street provides a left-turn lane, a through lane, and a combined through/right-turn lane on the eastbound and westbound approaches. Standard-style crosswalks are provided on both the east and west legs of the intersection. At its unsignalized intersection with the Marycrest Plaza access drive, Jefferson Street provides a through lane and a combined through/right-turn lane on the eastbound approach. On the westbound approach, Jefferson Street provides a left-turn lane and two through lanes. At its unsignalized intersection with the site access drive, Jefferson Street provides a left-turn lane and two through lanes on the eastbound approach. On the westbound approach, Jefferson Street provides a through lane and a combined through/right-turn lane. Sidewalks are generally provided on both sides of the roadway. Jefferson Street is under the jurisdiction of the Illinois Department of Transportation (IDOT), carries an Annual Average Daily Traffic (AADT) volume of approximately 30,100 vehicles (IDOT 2019), and has a posted speed limit of 35 miles per hour.

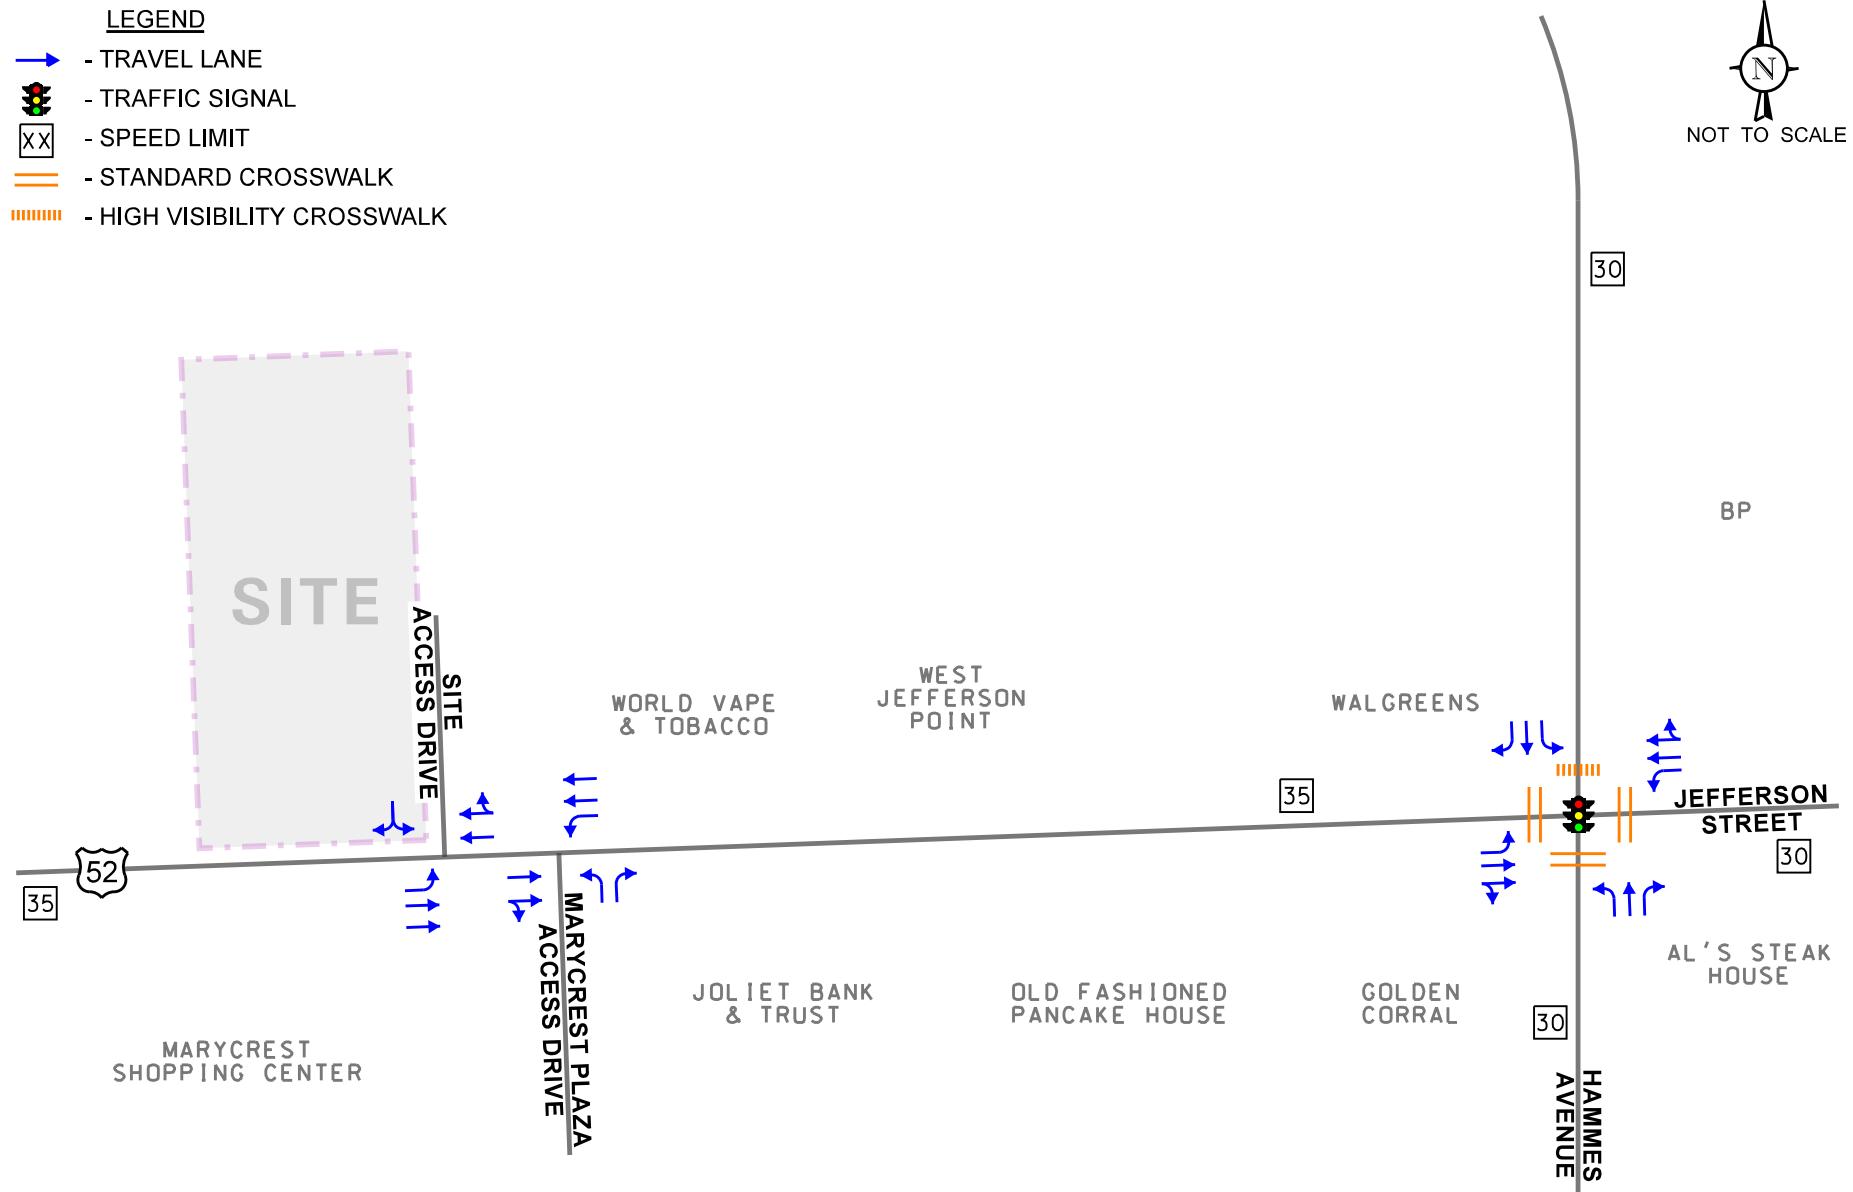

Hammes Avenue is a north-south major collector roadway that generally provides one lane in each direction in the vicinity of the site. At its signalized intersection with Jefferson Street, Hammes Avenue provides a left-turn lane, a through lane, and a right-turn lane on the northbound and southbound approaches. A high-visibility crosswalk is provided on the north leg and a standard-style crosswalk is provided on the south leg. Sidewalks are generally provided on both sides of the roadway. Hammes Avenue is under the jurisdiction of the City of Joliet, carries an AADT volume of approximately 4,050 vehicles (IDOT 2019), and has a posted speed limit of 30 miles per hour.

Proposed Justice
Cannabis Dispensary
Joliet, Illinois

Existing Roadway Characteristics

Marycrest Plaza Access Drive is a north-south private drive that provides one inbound lane and two outbound lanes at its intersection with Jefferson Street. The northbound approach provides a left-turn lane and a right-turn lane.

Site Access Drive is a north-south private drive that provides one inbound lane and one outbound lane at its intersection with Jefferson Street. The southbound approach provides a combined left-turn/right-turn lane. The access drive provides shared access to the site as well as the retail strip to the east of the site.

Existing Traffic Volumes

In order to determine current traffic conditions within the study area, KLOA, Inc. conducted peak period traffic counts at the following intersections:

- Jefferson Street (US 52) with Hammes Avenue
- Jefferson Street with Marycrest Plaza Access Drive
- Jefferson Street with Site Access Drive

The counts were conducted during the weekday morning (7:00 A.M. to 8:00 A.M.), weekday evening (4:00 P.M. to 6:00 P.M.), and Saturday midday (11:30 A.M. to 2:00 P.M.) peak periods on a typical weekday and Saturday in February and March 2022. The results of the traffic counts show that the peak hours of traffic generally occur between 7:00 A.M. and 8:00 A.M. during the morning peak period, between 4:00 P.M. and 5:00 P.M. during the evening peak period, and between 11:30 A.M. to 12:30 P.M. during the Saturday midday peak period.

It should be noted that due to the ongoing COVID-19 pandemic, it is anticipated that traffic volumes in the area generally do not reflect normal or typical conditions. As such, the 2022 traffic counts were compared to the 2019 two-way traffic counts on the IDOT Traffic Count Database System that were increased to reflect 2022 volumes with an annual growth rate, to be discussed later. Based on the comparison, the traffic volumes conducted in 2022 along Jefferson Street were increased by approximately 10 percent during the peak hours. The comparison determined that the 2022 traffic volumes on Hammes Avenue were higher or consistent with the IDOT traffic volumes and therefore no adjustments were applied.

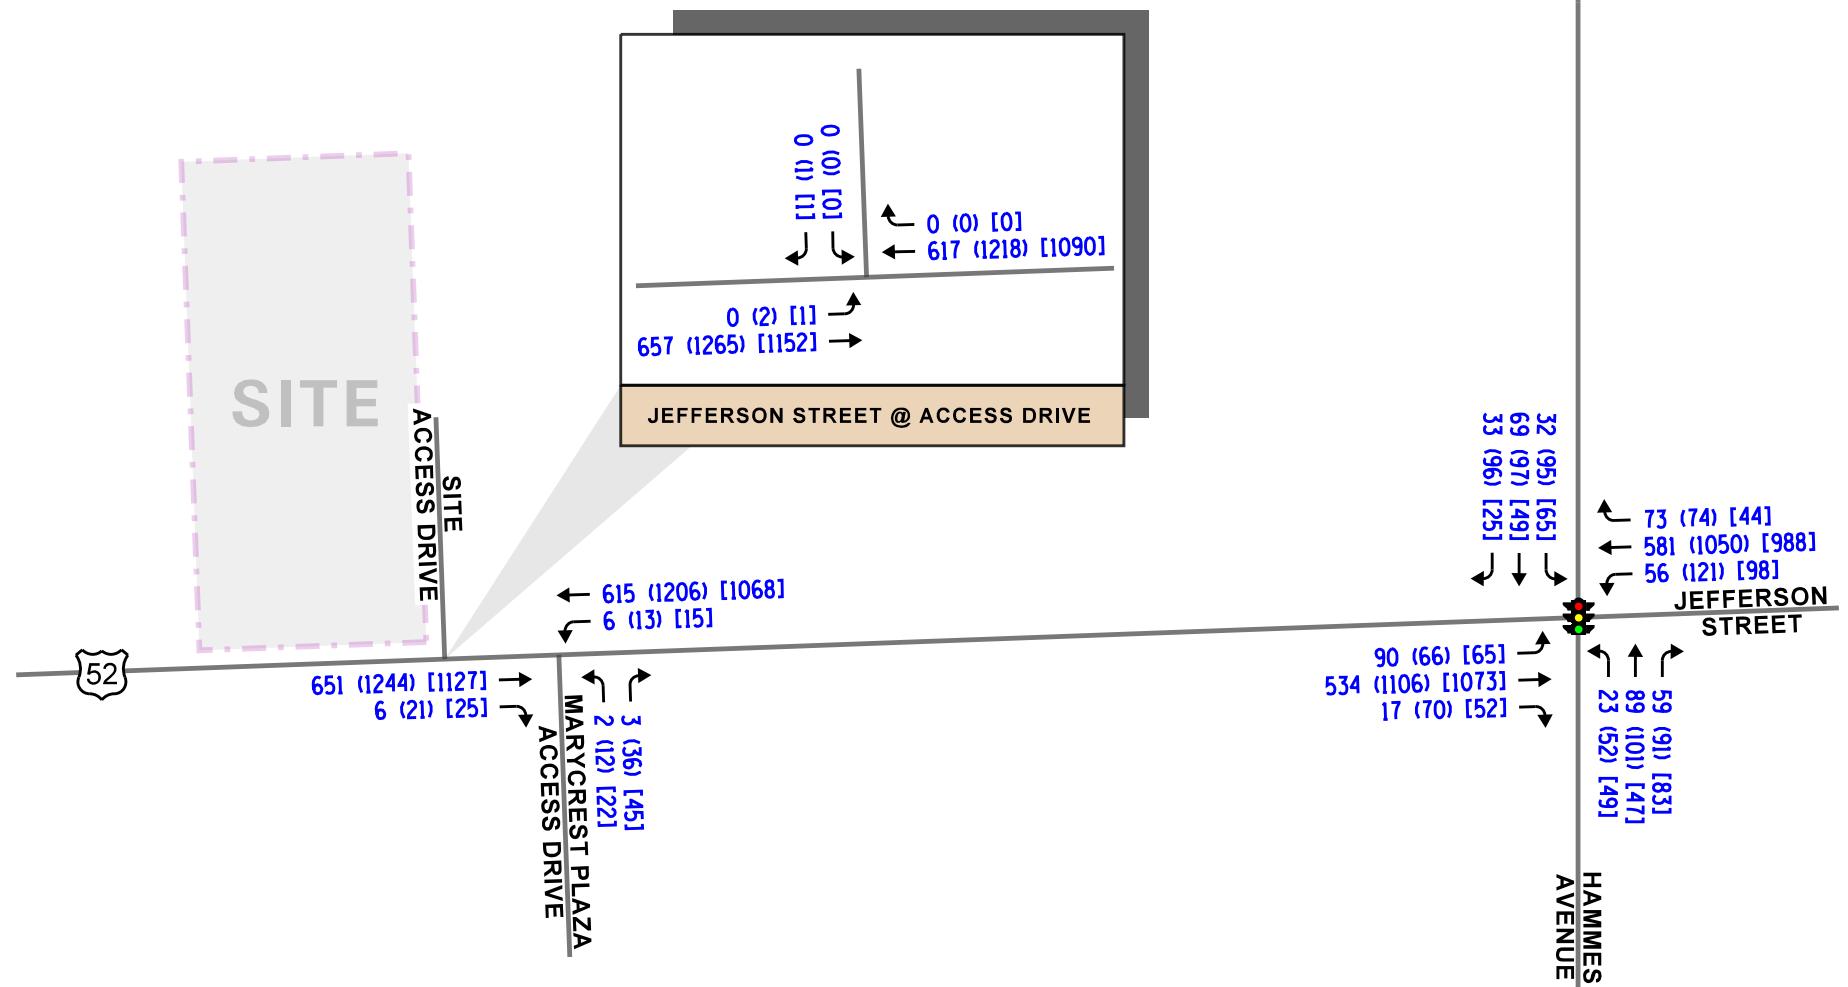

Figure 4 illustrates the Year 2022 base peak hour vehicle traffic volumes. Copies of the traffic count summary sheets are included in the Appendix.

Crash Analysis

KLOA, Inc. obtained crash data¹ from IDOT for the most recent available five years (2016 to 2020) for the intersections of Jefferson Street (US 52) with Hammes Avenue, Maryville Plaza access drive, and the site access drive. The crash data for the intersection of Jefferson Street with Hammes Avenue is summarized in **Table 1**. No crashes were reported at the intersections of Jefferson Street with Maryville Plaza access drive or the site access drive during the review period. A review of the crash data indicated that no fatalities were reported at any of the intersections during the review period.

Table 1
JEFFERSON STREET (US 52) WITH HAMMES AVENUE – CRASH SUMMARY

Year	Type of Crash Frequency						
	Angle	Object	Rear End	Sideswipe	Turning	Other	Total
2016	2	0	3	0	1	1	7
2017	0	1	7	0	2	0	10
2018	1	0	2	1	2	0	6
2019	3	0	3	0	0	0	6
2020	0	0	1	0	3	0	4
Total	6	1	16	1	8	1	33
Average	1.2	<1.0	3.2	<1.0	1.6	<1.0	6.6

¹ IDOT DISCLAIMER: The motor vehicle crash data referenced herein was provided by the Illinois Department of Transportation. Any conclusions drawn from analysis of the aforementioned data are the sole responsibility of the data recipient(s). Additionally, for coding years 2015 to present, the Bureau of Data Collection uses the exact latitude/longitude supplied by the investigating law enforcement agency to locate crashes. Therefore, location data may vary in previous years since data prior to 2015 was physically located by bureau personnel.

3. Traffic Characteristics of the Proposed Dispensary

In order to properly evaluate future traffic conditions in the surrounding area, it was necessary to determine the traffic characteristics of the proposed dispensary, including the directional distribution and volumes of traffic that it will generate.

Proposed Site and Development Plan

The site, which currently contains the former Bakers Square restaurant building, is located on the north side of Jefferson Street (US 52) west of Hammes Avenue. As proposed, the existing restaurant building will be repurposed to accommodate the dispensary. The repurposed building will be approximately 4,060 square feet in size and will provide approximately 65 parking spaces. Based on the information provided by the operator, the dispensary will be open from 8:00 A.M. to 10:00 P.M. and will have, on average, approximately six to eight employees per shift. In addition, the dispensary will receive approximately two deliveries per week and approximately two cash pick-ups per week. Access to the dispensary parking lot will continue to be provided via the existing shared access drive. This access drive is approximately 36 feet wide and currently provides one inbound lane and one outbound lane. Outbound movements should be stop sign controlled. A copy of the site plan is included in the Appendix.

Directional Distribution

The directions from which patrons and employees will approach and depart the site were estimated based on existing travel patterns, as determined from the traffic counts. **Figure 5** illustrates the directional distribution of the traffic generated by the proposed dispensary.

Peak Hour Traffic Volumes

The volume of traffic estimated to be generated by the proposed dispensary was based on trip generation rates published by the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, 11th Edition. **Table 2** shows the ITE trip generation estimates. The “Marijuana Dispensary” (Land-Use Code 882) rate was used for the proposed dispensary. It should be noted that based on information provided by the operator, the dispensary’s projected trips are approximately 300 customers per day. As such, the trip generation estimates were based on the ITE trip generation rates as they result in higher traffic volumes in order to provide conservative analyses.

Table 2
PROJECTED PEAK HOUR SITE-GENERATED TRAFFIC VOLUMES

Type/Size	Weekday Morning Peak Hour			Weekday Evening Peak Hour			Saturday Midday Peak Hour			Daily Two-Way Traffic		
	In	Out	Total	In	Out	Total	In	Out	Total	In	Out	Total
Proposed Marijuana Dispensary (4,060 s.f.)	22	21	43	38	39	77	58	59	117	429	429	850

4. Projected Traffic Conditions

The total projected traffic volumes include the existing traffic volumes, increase in background traffic due to growth, and the traffic estimated to be generated by the proposed subject dispensary.

Dispensary Traffic Assignment

The estimated weekday morning, weekday evening, and Saturday midday peak hour traffic volumes that will be generated by the proposed dispensary were assigned to the roadway system in accordance with the previously described directional distribution (Figure 5). **Figure 6** illustrates the traffic assignment of the total new trips.

Background (No-Build) Traffic Conditions

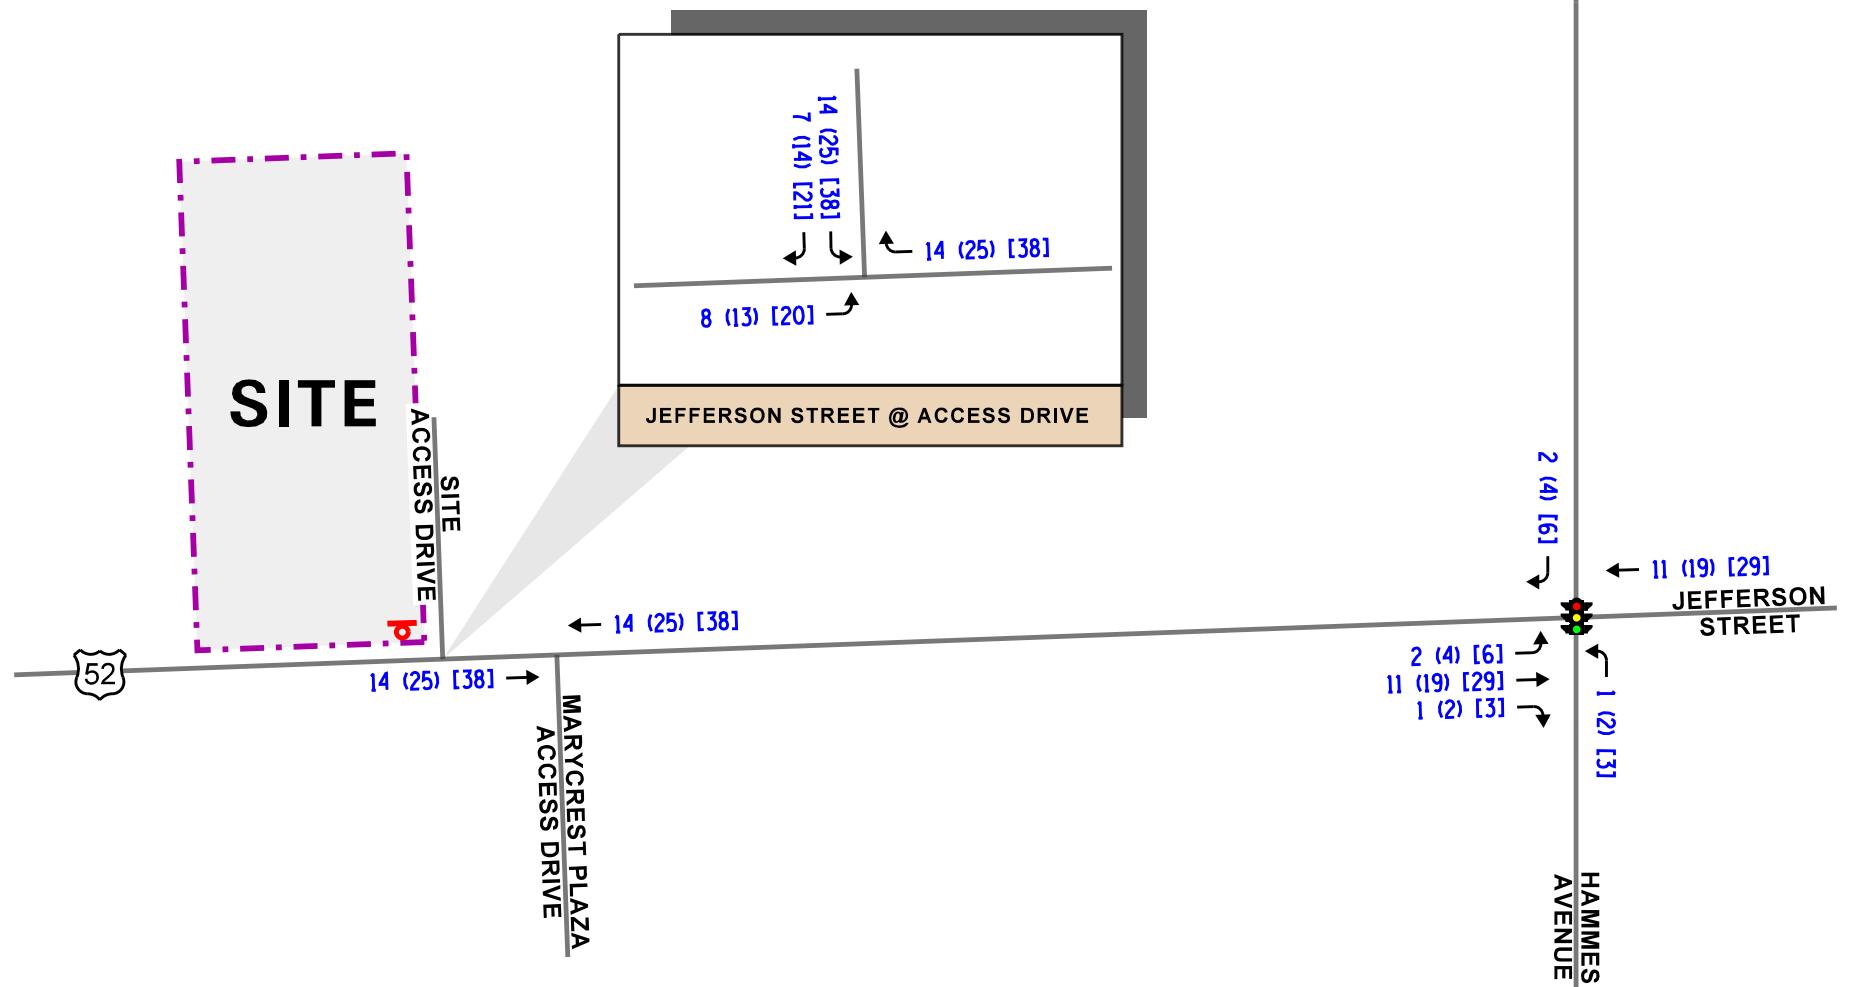

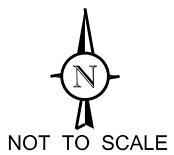

The Year 2022 base traffic volumes (Figure 4) were increased by a regional growth factor to account for the increase in existing traffic related to regional growth in the area (i.e., not attributable to any particular planned development). Based on AADT projections provided by CMAP in a letter dated March 23, 2022, the Year 2022 traffic volumes are projected to increase by a compound annual growth rate of 0.8 percent per year. As such, traffic volumes were increased by approximately 5 percent total to represent Year 2028 conditions (one-year buildout plus five years). A copy of the CMAP projections letter is included in the Appendix. The Year 2028 no-build traffic volumes, which include the existing traffic volumes increased by the regional growth factor, are illustrated in **Figure 7**.

Total Projected Traffic Volumes

The traffic to be generated by the proposed dispensary (Figure 6) was added to the existing traffic volumes accounting for ambient background growth (Figure 7) to determine the Year 2028 total projected traffic volumes, as shown in **Figure 8**.

5. Traffic Analysis and Recommendations

The following provides an evaluation conducted for the weekday morning, weekday evening, and Saturday midday peak hours. The analysis includes conducting capacity analyses to determine how well the roadway system and access drives are projected to operate and whether any roadway improvements or modifications are required.

Traffic Analyses

Roadway and adjacent or nearby intersection analyses were performed for the weekday morning, weekday evening, and Saturday midday peak hours for the base (Year 2022), Year 2028 no-build, and Year 2028 total projected traffic volumes.

The traffic analyses were performed using the methodologies outlined in the Transportation Research Board's *Highway Capacity Manual (HCM)*, 6th Edition and analyzed using the Synchro/SimTraffic 11 software. The analysis for the traffic-signal controlled intersections were accomplished using actual cycle lengths and phasings to determine the average overall vehicle delay and levels of service.

The analyses for the unsignalized intersections determine the average control delay to vehicles at an intersection. Control delay is the elapsed time from a vehicle joining the queue at a stop sign (includes the time required to decelerate to a stop) until its departure from the stop sign and resumption of free flow speed. The methodology analyzes each intersection approach controlled by a stop sign and considers traffic volumes on all approaches and lane characteristics.

The ability of an intersection to accommodate traffic flow is expressed in terms of level of service, which is assigned a letter from A to F based on the average control delay experienced by vehicles passing through the intersection. The *Highway Capacity Manual* definitions for levels of service and the corresponding control delay for signalized intersections and unsignalized intersections are included in the Appendix of this report.

Summaries of the traffic analysis results showing the level of service and overall intersection delay (measured in seconds) for the base, no-build, and total projected conditions are presented in **Tables 4** through **7**. A discussion of each intersection follows. Summary sheets for the capacity analyses are included in the Appendix.

Discussion and Recommendations

The following summarizes how the intersections are projected to operate and identifies any roadway and traffic control improvements necessary to accommodate the traffic to be generated by the proposed dispensary.

Jefferson Street (US 52) with Hammes Avenue

The results of the capacity analysis indicate that overall, this intersection currently operates at Level of Service (LOS) C during the weekday morning, weekday evening, and Saturday midday peak hours. Additionally, all approaches currently operate at LOS C or better during the peak hours. Under Year 2028 no-build and total conditions, the intersection is projected to continue operating at LOS C during weekday morning, weekday evening, and Saturday midday peak hours. All approaches are also projected to continue operating at LOS C or better. As such, no traffic signal modifications or roadway improvements are required at this intersection.

Jefferson Street with Marycrest Plaza Access Drive

The results of the capacity analysis indicate that the northbound approach currently operates at LOS B during the weekday morning peak hour and at LOS C during the weekday evening and Saturday midday peak hours. The westbound left-turn movement currently operates at LOS B during all peak hours. Under Year 2028 no-build and total conditions, the northbound approach is projected to continue operating at the current levels of service during the peak hours. The westbound left-turn movement is projected to continue operating at LOS B during all peak hours. As such, the intersection has sufficient reserve capacity to accommodate the development-generated traffic and no roadway or traffic control improvements are required.

Jefferson Street with Site Access Drive

The results of the capacity analysis indicate that the southbound approach currently operates at LOS A during the weekday morning peak hour and at LOS B during the weekday evening and Saturday midday peak hours. The eastbound left-turn movement currently operates at LOS A during the peak hours. Under Year 2028 no-build conditions, the southbound approach and the eastbound left-turn movement are projected to continue operating at their current levels of service. Under Year 2028 total conditions, the southbound approach is projected to operate at LOS B during the weekday morning peak hour and at LOS C during the weekday evening and Saturday midday peak hours. The eastbound left-turn movement is projected to continue operating at LOS A during all three peak hours. As such, no roadway improvements or traffic control improvements are required.

On-Site Circulation

The proposed plan calls for maintaining the existing on-site circulation. Signage and striping should be updated as they may have faded due to the building vacancy. Based on the above, the proposed site plan allows for efficient circulation minimizing on-site vehicle and pedestrian conflicts.

Parking Evaluation

As previously indicated, the dispensary will be approximately 4,060 square feet in size and will provide approximately 65 parking spaces. In order to determine the future parking need of the proposed dispensary, the parking demand was estimated based on the City of Joliet Code of Ordinances and parking rates published in the Institute of Transportation Engineers' (ITE) *Parking Generation Manual*, 5th Edition. Based on the two methodologies, the parking demand for the proposed dispensary will be as follows:

Parking Requirements per City Code

- Retail Stores
 - 23 parking spaces (ratio of one space per 180 s.f.)

Based on the above and the requirements of the City of Joliet, this translates into 23 parking spaces, which results in a surplus of 42 parking spaces.

ITE Parking Generation Manual

- Dispensary (Land Use Code 882):
 - 29 parking spaces (ratio of 7.19 spaces per 1,000 s.f.)

Based on the above and the rates published in the ITE *Parking Generation Manual*, this translates into 29 parking spaces. Therefore, the proposed parking supply of 65 parking spaces will exceed the ITE estimated peak parking demand of 29 parking spaces.

6. Conclusion

Based on the preceding analyses and recommendations, the following conclusions have been made:

- The roadway system has sufficient reserve capacity to accommodate the traffic projected to be generated by the proposed Justice Cannabis dispensary and no additional roadway improvements or traffic control modifications are required.
- The new traffic generated by the proposed dispensary will have a limited impact on the intersection of Jefferson Street (US 52) with Hammes Avenue, as it will account for less than three percent of the traffic traversing it.
- The access drive on Jefferson Street will provide flexible and efficient access to and from the site and will be adequate in accommodating site traffic.
- A stop sign should be added for outbound movements from the site onto Jefferson Street.
- The proposed parking supply of 65 parking spaces will be adequate in meeting the projected parking needs based on the City of Joliet ordinance and parking rates published in the Institute of Transportation Engineers' (ITE) *Parking Generation Manual*, 5th Edition.

Subject: Jefferson Street (US 52) at Hammes Avenue
IDOT

Dear Mr. Pachowicz:

In response to a request made on your behalf and dated March 21, 2022, we have developed year 2050 average daily traffic (ADT) projections for the subject location.

ROAD SEGMENT	Current ADT	Year 2050 ADT
Jefferson St (US 52), @ Hammes Ave	30,100	35,100
Hammes Ave, @ Jefferson St	4,050	5,700

Traffic projections are developed using existing ADT data provided in the request letter and the results from the December 2021 CMAP Travel Demand Analysis. The regional travel model uses CMAP 2050 socioeconomic projections and assumes the implementation of the ON TO 2050 Comprehensive Regional Plan for the Northeastern Illinois area. The provision of this data in support of your request does not constitute a CMAP endorsement of the proposed development or any subsequent developments.

If you have any questions, please call me at (312) 386-8806.

Sincerely,

A handwritten signature in black ink, appearing to read "J. Rodriguez".

Level of Service Criteria

LEVEL OF SERVICE CRITERIA

Signalized Intersections		
Level of Service	Interpretation	Average Control Delay (seconds per vehicle)
A	Favorable progression. Most vehicles arrive during the green indication and travel through the intersection without stopping.	≤ 10
B	Good progression, with more vehicles stopping than for Level of Service A.	>10 - 20
C	Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear. Number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.	>20 - 35
D	The volume-to-capacity ratio is high and either progression is ineffective or the cycle length is too long. Many vehicles stop and individual cycle failures are noticeable.	>35 - 55
E	Progression is unfavorable. The volume-to-capacity ratio is high and the cycle length is long. Individual cycle failures are frequent.	>55 - 80
F	The volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.	>80.0
Unsignalized Intersections		
Level of Service	Average Total Delay (SEC/VEH)	
A	$0 - 10$	
B	$> 10 - 15$	
C	$> 15 - 25$	
D	$> 25 - 35$	
E	$> 35 - 50$	
F	> 50

Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 11 (8%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 120

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.80

Intersection Signal Delay: 30.8

Intersection LOS: C

Intersection Capacity Utilization 68.4%

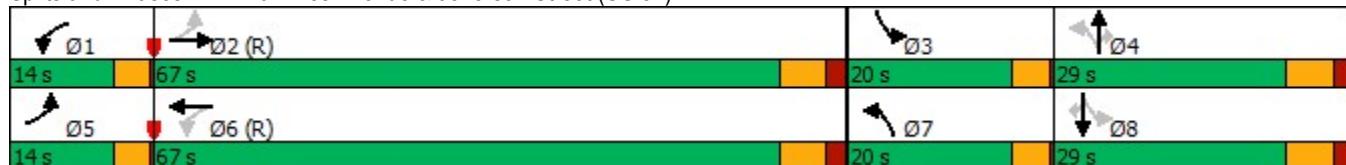

ICU Level of Service C

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Hammes Avenue & Jefferson Street (US 52)
